ENFLOW

WHITEPAPER · VERSION V3.0.0

Corporate memory, one question away.

Enflow AI: an AI layer built on top of end-to-end enterprise process management while preserving its values. An overview of modules, principles and architecture.

Enflow AI · Enterprise Process Management

November 2026

A platform that protects process integrity and opens information to questions

Enflow is a multi-tenant enterprise process management system that runs a B2B company's business lifecycle, from sales opportunity to contract and from project to procurement and finance, on a single platform. Up to v2.5.0 it was built on process integrity, permission discipline and auditability.

Enflow AI v3.0.0 adds an AI layer on top of this foundation without changing it. Instead of searching for information across screens, users ask; the assistant builds its answer only from data the user can see on their own screens, asks what is meant when needed, and states which screen the information came from.

Access to analytics

Dashboard indicators, profitability and management analytics, unit reports; with a single question, together with an explanation of the calculation.

Corporate memory

Contracts and specifications, corporate documents, risks and lessons learned, the audit trail; available the moment they are needed.

Uncompromising principles

Permissions apply exactly as before; with a local model, data stays inside the company.

30
screen modules

21
assistant read tools

8
virtual unit agents

1,000+
automated permission tests

What has not changed since day one

The founding principle of Enflow AI was to preserve, exactly, the principles of the working Enflow: its end-to-end flow, its role and permission structure and its approval chains. AI does not replace these values; it carries them.

01 End-to-end process integrity

From visit to opportunity, proposal, tender, contract, project, procurement and finance, every step inherits the data of the previous one; hand-offs between units are automatic.

In Enflow AI: the assistant reads every link of the chain and skips no step.

02 Permission discipline

Roles and permissions are enforced on every screen and every API endpoint; for example, a sales representative sees only their own opportunities.

In Enflow AI: the assistant passes through the same gate; data that cannot be seen on screen cannot be seen in the assistant either.

03 Auditability

Every change is written to the audit trail with who made it and when; approval chains (Finance, Business Development, General Manager, Contracts) are persistent.

In Enflow AI: every assistant run is recorded with its tool usage; message content is not stored.

04 Automation under human control

Virtual agents fill empty unit seats; on money and legal matters they are advisory only, and their autonomous actions must be reversible.

In Enflow AI: the assistant is read-only; it cannot create, change or approve records.

05 Data security and isolation

Each tenant's data is separate; fields such as the AI key, IBAN and tax details are encrypted with a tenant-specific key; row-level security in PostgreSQL.

In Enflow AI: record IDs and personal contact details are not sent to the model.

06 Provider independence

The AI provider is not hard-coded; each company chooses its own provider with its own key.

In Enflow AI: with a local model, data never leaves the company; settings are determined automatically for the model.

07 Corporate memory

Document coding, corporate documents, the physical archive, the risk register, lessons learned and unit reports; the company's accumulated knowledge, on record.

In Enflow AI: this knowledge is not searched screen by screen; it is asked for.

08 Honesty

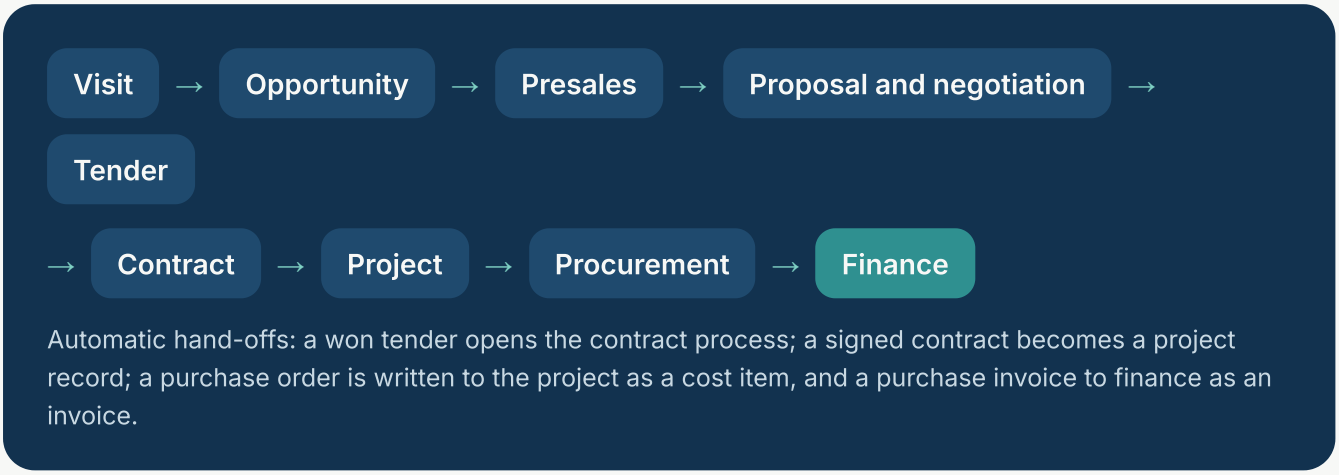

The system does not make up what it does not know: if AI is not configured, new features do not silently fall back to sample data; they clearly say they are unavailable.

In Enflow AI: it says when there is no data, asks what is meant on an ambiguous question, and states that it can make mistakes.

04 · JOURNEY AND END-TO-END FLOW

One chain, end to end

A piece of work moves along the same chain of records from the first field visit to collection. Hand-offs between units are automatic: each unit takes over the work with the previous unit's data.

Automatic hand-offs: a won tender opens the contract process; a signed contract becomes a project record; a purchase order is written to the project as a cost item, and a purchase invoice to finance as an invoice.

From the beginning to today

Foundation	Persistent approval chain and unit swimlanes, visit plan and daily report, project hand-over package, tenant-specific document coding, default workflow template.
Units	Finance, legal and tender modules; management reporting with unit metrics, workflow bottleneck and unit reports.
Automation	Eight virtual unit agents, automatic hand-offs between units, and an autonomous action framework that allows only reversible actions.
Deepening	Cost analysis version history, visit performance, tenant data encryption, delivery time and late penalty tracking, profitability and cash–treasury analysis, professional services.
Production readiness	Least-privilege database roles, PostgreSQL row-level security, compiled production runtime, a separate PostgreSQL migration track and a safe upgrade tool. Enflow v2.5.0 was completed at this point.
Enflow AI v3.0.0	An AI layer built on top of the latest working release, which is preserved: the assistant, read tools for every module, dashboard, profitability and management analytics, contract and specification analysis, local model support and model profile.

Where opportunities are born

From the field visit to the won tender, every step, cost and decision of the sale is on record. Management follows this flow from a single cockpit.

Dashboard

Corporate Cockpit: indicators shown by role and permission; sales pipeline, revenue and cash, task and approval load. Management Reports: unit metrics, workflow bottleneck, unit reports and incoming reports.

Each role gets its own view with Cockpit Templates

Visit Plan

Weekly field plan, daily visit report, visit-to-opportunity conversion and visit performance.

Sales Support · Tender

Tender and İSAB processes, guarantee tracking, specification upload and AI specification analysis; a won tender automatically opens the contract process.

CRM and Customers

The full lifecycle of the customer relationship and the sales opportunity; a representative sees only their own opportunities, a manager sees the whole pipeline.

- **Overview** · pipeline summary
- **Customers** · organizations and contacts
- **Opportunities** · stage, probability
- **Cost Analysis** · version history
- **Proposals** · approval chain
- **Live Negotiations** · bargaining

Presales and Design

The unit where the technical solution and the cost are built; product list, design and specification compliance in one place.

- **BoM and Design** · product list
- **Specification Analysis** · AI-assisted
- **Compliance** · specification ↔ product

Where promises are delivered

A signed contract passes data to the project, the project to procurement, procurement to finance. Whether a job is profitable is measured by actual records, not estimates.

Contract Management

Contract and administrative specification records, section-by-section AI analysis (obligations, penalties, guarantees, deadlines), legal approval; hand-off to the project after signature.

Project Management

Project hand-over package, milestones, delivery time and late penalty tracking, risk register and lessons learned.

Procurement

Requests, supplier quotes and orders; an order is automatically written to the project as a cost item, and a purchase invoice to finance as an invoice.

Warranty and Service

Warranty periods of delivered products, service records and maintenance tracking.

Professional Services

Effort and delivery tracking for installation, consulting and service work.

Finance

Invoicing, collection and payment; cash flow and treasury view, finance approval chain.

Profitability

Gross profit and margin by project, customer and product group; comparison of proposed and actual, cash–treasury analysis.

DMO Catalog

Tracking of DMO catalog products and prices used in public procurement.

The layer that carries order and memory

Tasks, documents, permissions and the audit trail; the modules that define how the company works and what it accumulates.

Tasks and Tracking
Work assigned to individuals, pending approvals and time tracking.

General Terms
Company terms and clauses shared across all proposals.

Company Documents
Corporate Documents and Physical Archive; validity dates and location information.

Audit Trail
Who made each change, and when.

Backup
Backup and restore of tenant data.

Security Check
Regular review of permissions and configuration.

Virtual Agents
Eight virtual unit agents fill empty unit seats and run the approval chain. Finance and legal agents are advisory only; autonomous actions must be reversible.

Company Settings
Where the platform is shaped to the company; permission and workflow definitions are managed here.

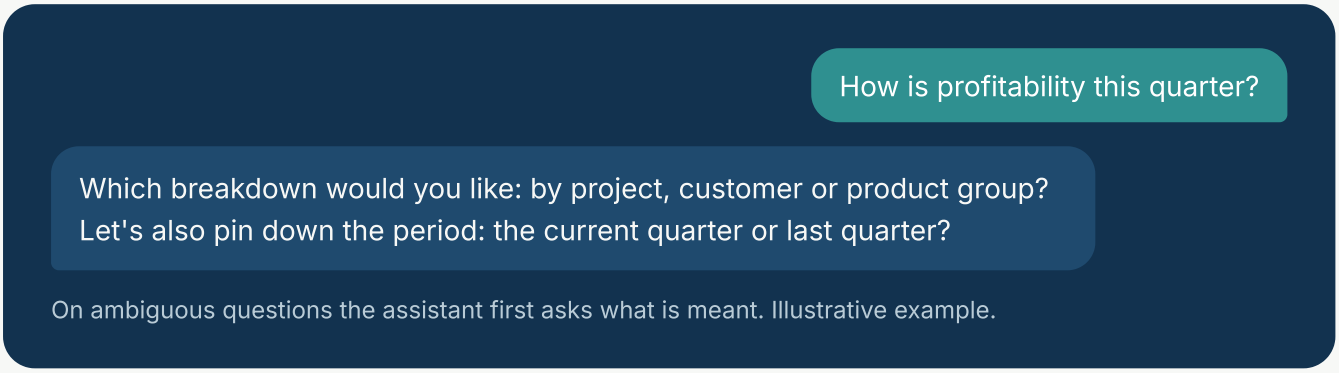

- Company Profile
- Workflow
- Subscription and Usage
- Cockpit Templates
- Units
- Permissions
- License Plans
- Brand and Product Group
- Users
- Integrations

Requests and Feedback
Users' platform requests and suggestions.

Help
Module guides and usage notes.

Asking instead of searching screen by screen

The assistant presents everything a user can see on their screens through a single chat window. It builds its answer from current records, not from the model's memory.

On ambiguous questions the assistant first asks what is meant. Illustrative example.

Reads every module

With 21 read tools, from CRM to finance and from documents to the audit trail; dashboard indicators, profitability and management analytics included.

Picks tools for the question

For each question only the relevant tools are offered to the model; accurate, fast answers even on small local models.

Asks for the period, names the source

On date-bound questions it asks for the period if none is given; it states which screen the answer came from and how it was calculated.

Analyzes long documents in parts

Contracts and specifications are split, each part is reviewed separately and the results are merged; the analysis runs in the background.

Does not make things up

If there is no data, it says so; if it tries to answer without using its tools, it is redirected.

States its limits openly

An always-visible notice in the window: the assistant can make mistakes; check the source screen for important decisions.

The company's data, the company's control

The AI layer adds no new exception to the platform's security model. The assistant passes through the same gates the user passes on screen and stops at the same limits.

Permissions identical to the screen	Every assistant tool goes through role and permission checks. Dashboard indicators open by module permission or role template; reports are limited by the user's unit scope and ownership rules.
Tightening at the API level	While the assistant's scope was widened, the dashboard and report API endpoints were reviewed too; what the screen does not show, the API does not return. Over a thousand automated permission tests run on every change.
Tenant isolation	Each company's data is separate; PostgreSQL row-level security and least-privilege database roles. Sensitive fields are encrypted with a tenant-specific key.
Data sent to the model	Record IDs and personal contact details are not sent to the model. Assistant runs are written to the audit trail with their tool usage; message content is not stored.
Local model	With local servers such as Ollama, LM Studio or vLLM, data never leaves the company. If a cloud provider is preferred, the company uses its own key.
Self-tuning model profile	The connected model's context length and speed are measured; input size, answer length and timeouts are set accordingly. When moving to a larger model, the settings update themselves.

Continuity: when AI is switched off, Enflow keeps working. All modules, approval chains and reports are independent of AI; only the assistant and analysis features become unavailable, and the system says so clearly.

10 · CLOSING

Same values, far easier access

From day one, Enflow was designed so that work runs end to end, with permission discipline and in an auditable way. Enflow AI did not change this structure; it only shortened the path to the knowledge accumulated inside it to a single question.

Analytics are no longer hunted across screens, and corporate memory is available at any moment. Throughout, permissions apply exactly as before, data stays under the company's control and the final decision always rests with a person.

Ask
From dashboard to profitability, every analysis with one question.

Verify
Every answer comes with its source screen.

Decide
Approval and action stay with the authorized person.
